PREFACE

The wealth of scientific information which French medicine has to offer can properly be grasped by those who are able to be in constant touch with the literature in its original language. The monumental work of the individual investigators in each chosen specialty is overwhelming by its profound erudition. The accumulated data during the recent war prove amply that the power of observation in its accuracy and precision as revealed by French scientists deserves special attention. To those who are willing to follow up closely the progress in French medicine in the original writings the present Dictionary is offered. Moreover, those who since the cessation of hostilities have decided to continue the study of the language will find in the Dictionary a means of learning its proper pronunciation. Each French word is accompanied by a combination of letters in English giving the pronunciation as accurately as possible.

On a separate page a key for the latter is added and should be consulted frequently.

Finally on the last page a table is presented showing measurements in the metric system corresponding to that used in United States.

ALFRED GORDON.

KEY TO THE PRONUNCIATION OF THE FRENCH WORDS

French

a is designated as "ah" (English). It should have the same sound as "a" in the word "margin."

é or *è* is designated as "eh" (English). Pronounce as "e" in the word "never." e (not accented) is pronounced as "eh" but with lips very slightly open.

eu is also designated as "eh," but the "e" of "never" should be pronounced with the lips only *very* slightly opened and prolonged.

oeu. Same as "eu."

i should be pronounced as English "e" but the sound must be soft and prolonged. It is designated as "ee" (like "ea" in "teamster").

o is designated as "oh" like in the English exclamation: oh!

u is pronounced like the English "u," but the pouting of the lips must be *very much* less marked.

eille is designated as "ay." That means that the letter "a" of the "ay" should be pronounced like "a" in "table" but more prolonged and soft.

y is designated as English "ee" and pronounced like French "e" (see above).

en is designated as "ahn." It should be pronounced like the French "a" (see above), but prolonged and soon abandoned with a nasal intonation. The "n" of the "ahn" should not be distinct. But in "enn" there should be no nasal intonation and both n's must be distinctly pronounced.

c before "e" or "i" must be pronounced like "s."

tion is designated as "ssion;" in which the "i" is pronounced like a *very* soft English "e" and very rapidly joined to "on." The "n" should be given a nasal intonation but not a distinct English "n."

g before the vowels "e" and "i" is to be pronounced as "zsh."

j the same as "g."

ou is to be pronounced as English "oo" in the word "smooth."

oi is to be pronounced as English "ooah" but rapidly.

eui is designated as "ehy" in which the "eh" is pronounced as above (see "eu") and the "y" is added only to render the "eh" soft and prolonged but it should not be pronounced like an English "y."

ai is designated as "eh" (see above for the latter).

oui is designated as "ooy." The "y" should not be pronounced like English "y." It is added only to render the "oo" sound prolonged and especially "soft."

illo is designated as "eeyoh." For the pronunciation of "ee" and "oh" see above. The "y" is added to render the "o" *very* soft.

in is designated as "ehn." For pronunciation see "eh." The latter sound must be prolonged and ended abruptly with a nasal intonation, but the "n" should not be pronounced as a distinct English "n."

All French words of more than one syllable are accentuated on their last syllable.

3d Edition, Revised, Enlarged. By R. J. E. Scott, M.A., B.C.L., M.D.

Flexible Cloth, $4.00. With Thumb Index, $4.50

A modern, pronouncing medical dictionary prepared for the practicing physician, surgeon, student, reference library and for all who may have occasion to look up the pronunciation, definition, derivation and other particulars concerning any of the more than 71,000 medical words in use. This book, by actual count and comparison with other dictionaries of the same scope has been found to exceed all in respect to the number of terms it comprises. Many of the words in frequent use pertaining more especially to related sciences are included besides useful tables in compact form for convenience in reference.

"This new edition is unsurpassed as to comprehensiveness, clearness, and size. . . To reduce the size of the book and to make it a handy volume, a small type had to be selected, but the type is very clear and legible, and is even a little larger than that used in Webster's Unabridged Dictionary. Each word is accompanied by its pronunciation and followed by its etymology. The definitions are clear and concise. . . It is unique among modern medical dictionaries and cannot fail to receive a hearty welcome by the medical practitioner and the student of medicine."—*Science.*
